Newbies should use Photoshop Elements because the program is free and also because it is designed to be more for a beginner's level of ease of use. Virtually any type of image can be used for a great portrait. Beginning photojunkies are just beginning. They are at a level where they're not happy with anything they get unless it's perfect. Yet all the portraits in this book are created with Photoshop and most are the natural style of a portrait.

Judging Poses After you select your image and figure out the settings and features of your camera, you're ready to start creating a portrait. For the best portrait, you want to select the _best_ pose. This means you want to work with a _great_ photograph. But what is good? Well, for starters, the photographer should set the scene appropriately and the lighting should be just right. Additionally, a good pose has an interest-level and believability factor that makes a subject look more interested.

A California State Route 125 highway worker was killed and two others injured after a truck hit a concrete barricade and then hit them, California Highway Patrol officials said Saturday. Ricardo Shute, 51, of Monterey was killed on Friday in Stanislaus County. Two other highway workers and one truck were also injured, officials said. Authorities weren't saying what led to the crash on State Route 125 at Dennis Creek Road in Lindsay. The victims' families identified the victims as Shute, his wife Susanna and his daughter Roberta. Another workman who was hurt was expected to survive, officials said. The Associated Press contributed to this report.
Q: I want to write a ruby method to count how many times an element appears in an array... was this a good approach? I want to write a method that will count how many times an element appears in an array. I found some code on the internet and I thought about using it as a model. I am pretty new at ruby, and wanted to know is this a good approach?
def frequency(data) data.each_with_object(Hash.new(0)) do |x, hash| hash[x] += 1 end end
I was thinking of having a sorted array, and then incrementing each element and storing the value in an hash. Thanks, Ran
A: There is no need to sort the array. For example, **def frequency(data)** data.inject(Hash.new(0)) do |counts, x| counts[x] += 1 end end should also work. Of course, you don't necessarily need the {} brackets. Any reference is enough. See it in action: data = [2, 4, 3, 2, 5, 5] frequency(data) #=> {2=>1, 3=>2, 5=>1} × Thanks for reading! Q: Given a string of length n, return the indices where it is of length m I need a python function to take a string of length n that will return the indices of the string where it is of length m for example: alpha('abcdef') -> (3, 7) I tried to solve it with the bisect module but the idea is to extract the indices from bisect module, for example (3, 7) but the bisect_right function can only give one string as output, so I cannot get the indices of the given string. Here's what I came up with: **def find_indices(L, length):** if len(L) == 0: return [] lengths = [(L[i] for L in L) for i in range(len(L) - 1, -1, -1)] left = L[0] right = L[-1] left_indices = list(range(length[0] - 1, -1, -1)) right_indices = list(range(0, length[0] - 1)) lengths[0], lengths[-1] = 0, len(left) while len(left) > 0: width = lengths[-1] if left == right: break if length[-1]
